About me

Hi, I'm 24 years old and I'm a software developer, currently focused on web development.

I'm fascinated by the world of technology and since then my goal is to grow as a professional by constantly acquiring tools in the area.

I'm also a student of systems engineering at the Universidad Abierta Interamericana.

Skills

Clean code writing, Teamwork, Problem-solving, Curious, Versatile, Good written and verbal communication, Self-management of staff and the team.

JS JavaScript - Advanced	TS TypeScript - Medium
React Js - Advanced	Node Js - Advanced
NEXT. Next Js - Basic	Tailwind Css - Basic
PostgreSQL - Medium	MongoDB - Medium

Experience

Software Developer — Full-time

Previously I worked as a semi-senior developer for a company in Rosario, with international clients.

I participated in several projects ranging from administrative applications and ERP systems to eCommerce and eLearning platforms. In all cases, I worked under the agile Scrum methodology, which allowed an efficient organization and continuous delivery of value.

The technologies used included React as the main frontend technology, along with Node.js, Express, and databases such as MongoDB or PostgreSQL for the backend. For state management we used Redux Toolkit, and ensured code quality by implementing unit tests with Jest, Vitest and Supertest. For HTTP request management, we work with tools such as Axios or SWR, adapting to the specific needs of each project.

Software Developer — Part-time

I worked as a junior developer for a company in the city of Rosario, in that period I was developing an ERP for another company. This company wanted me to manage their employees, clients, projects, among other functions.

I was part of the team from the initial discovery phase, where we converted customer requirements into technical and executable specifications. I was actively involved in all phases of product development, including design, implementation and testing in the Alpha and Beta testing phases.

I worked on the frontend and backend using the MERN stack:

Frontend: React.js along with libraries like Material-UI and Redux for efficient state management.

Backend: Node.js with Express.js and MongoDB as database. Data validation with Joi and client-server communication design through REST API.

I performed the implementation of unit tests using Jest and Supertest. We followed the agile Scrum methodology, participating in dailies, sprints and retrospectives to ensure an iterative delivery aligned to the client's goals.
